Get Things Done with Super Slim Jaws

Easy clamping!

Open jaws easily with just two fingers.

Quick Start!

No wait time after powering on. Start measuring instantly without zero calibration.

LCD with beautiful back light

With the bright back light, you can easily read the measurement value even in dark locations.

Alarm Function

Set the alarm to audibly and visually notify yourself that the resistance or current value exceeds the threshold.

Clamp at the narrowest point!

The dramatically slim 0.79 inch (20mm) jaws let you finish your job easily and efficiently.

High Accuracy and Repeatability

Well-designed magnetic shields eliminate the leakage flux between the two cores that often affect measurement accuracy.

Large storage capacity (up to 2,000 data)

You can store up to 2,000 measurement values in the field and recall them in your office later.

Applications

Multiple grounding can be easily checked with the clamps.

Hazardous Storage Tanks

Measurement Principle

Can measure Multi-Grounded systems.

Clamp on the earth cable. The instrument has two cores for voltage injection and current measurement.

1. The voltage transducer injects a defined voltage into the multi-grounded system.
2. From the defined voltage and measured current, the total circuit loop resistance is calculated in the following equation.

$$Rx + \frac{1}{\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3} + \frac{1}{R_4}} = \frac{V}{I}$$

In a typical multi-grounded system, the parallel resistance value is small enough to be ignored and the equation as referred on the left can be simulated as follows.

$$Rx = \frac{V}{I}$$

Measurement Examples

In multi-grounded system, the larger the number of grounding poles, the more accurate the measured value. Where the number of grounding poles are few, if just only one carries a very small resistance (e.g., 1Ω), the measured value will be close to the true value. On the other hand, poles with large resistances (e.g., 100Ω) will result in greater measurement uncertainties.
